

# Failure to Load DACP Commitments

PAG Meeting  
September 30, 2010

At the PAG meeting on August 26, 2010, the IESO took an action item to “review and document the process for the situation where a DACP schedule of record is issued and constraints can’t be loaded in contract manager as a result of a tool problem”.

- There is a low probability that tool problems will prevent DACP commitments from being loaded either automatically or manually.
- The IESO will document the internal procedure for notifying market participants when this occurs.
- Market participants with a day-ahead commitment will be responsible for offering in a way that will result in a pre-dispatch and real-time schedule that reflects their commitment and will result in the desired DA-PCG treatment.

- We will notify market participants if there will be a delay in issuing the Day-Ahead Commitments Report (MPI and web message)
- The notification will include the following information:
  - Due to IESO tool problems, the DACP commitments may not be reflected in the pre-dispatch schedule for dd/mm/yy. Market participants with a DACP commitment should offer in a manner that will achieve a schedule and dispatch that reflects the day ahead commitment received.

- When the IESO tools become available we will:
  - Make your DACP commitments available to the pre-dispatch and real-time scheduling processes
  - Issue your commitments report and
  - Notify you that the commitments are available to pre-dispatch. The notification message will contain the following information:
    - The IESO tool problems have been repaired. Day-ahead commitments will be reflected in the pre-dispatch schedule for dd/mm/yy.
