

Feedback on November 19, 2004 CRSC meeting from Veridian

Regarding the discussion as to whether XML would be a preferred solution for PDF's and PSS's, we have identified no issues that would prevent our support. Although the existing format is functional for the PDF's and PSS's, if the move to XML is to be consistent across all IMO interfaces (such as the actual meter data – instead of the current EDI format available) then XML would be the preferred format.

Regarding the discussion on the level of "granularity" found in the PDF's and PSS's, we support maintaining as a minimum the existing level of granularity. We've identified no issues that would prevent our support for additional charge codes, assuming they would be available in the daily PSS's as they are currently.
